

This picture shows us a camera. It is really related to artificial intelligence and our lives. Cameras like this are very useful in our lives. They can record everything that happens near them so they can help reduce crime and help police find criminals. Also, these cameras are related to artificial intelligence. After recording people on the street, AI can help analyze how many people are here normally and when the number of people goes on the top. It can help people who want to travel here to make a decision.

The picture shows us there is artificial intelligence in the class. Teachers can use AI technology to teach students and AI can make the class easier. For example, AI can help teachers analyze every student's weaknesses and strengths, and make plans for the students. As well, AI can help students understand the knowledge from the textbook because AI knows what they do not understand. The most important is that AI technology can make the class more effective because students all have their own study plans made by AI, and they can easily follow the plans to study.
